Package 'skMisc'

January 16, 2021

Title Sercan Kahveci's Miscellaneous Functions

 $\textbf{Version} \ \ 0.01$

Description Contains a wide range of functions.					
Depends R ($i = 3.6.1$), magrittr, dplyr, doParallel, lmerTest					
Imports tidyr, knitr, quanteda					
License GPL-3					
License Gi L-0					
BugReports https://github.com/Spiritspeak/skMisc/issues					
LazyData true					
ByteCompile true					
RoxygenNote 7.1.1					
Ttoxygenivote 7.1.1					
R topics documented:					
AnovaTable					
clamp					
coerce					
colVars					
combobulate					
comboTable					
compcorr					
CorrCrunch					
CorTable					
$\operatorname{df.init}$					
ExpandFormula					
ExtractRandomTerms					
FindTopTerms					
LevenshteinDistance					
logit.weightfun					
multimerge					
OLcrunch					
pair					
${\rm read.csv.folder} \ldots \ldots$					

 2 AnovaTable

	splitColumn	15
	theme_pecher	16
	tokens_compound_stepwise	16
	TransformPlots	16
	trypackages	17
	verify_types	17
	wtd.median	18
Index		19

AnovaTable

 $Compare\ multilevel\ models$

Description

Compare multilevel models

Usage

```
AnovaTable(
    ...,
    fullmodel,
    models,
    serial = F,
    suppress = c("AIC", "deviance", "logLik")
)

## S3 method for class 'AnovaTable'
print(x)
```

Arguments

• • •	Model objects to be compared
fullmodel	A model to which all other models are to be compared; only use if \dots is not specified.
models	Models to compare to fullmodel. Only use if is not specified.
serial	If TRUE, models are compared serially; if false, all models will be compared to the first.
suppress	Character vector of column names to suppress in printed output.

Value

A data frame containing model fit metrics such as AIC, BIC, marginal R-squared (the effect size of fixed effects only), conditional R-squared (the effect size of all model terms), loglikelihood, deviance, and a likelihood ratio test.

clamp 3

clamp clamp

Description

clamp

Usage

```
clamp(val, minval, maxval)
```

Arguments

val The vector/matrix to clamp

minval Minimum value; all lower values are clamped to this value

maxval Maximum value; all higher values are clamped to this value

Value

Clamped vector.

Examples

clamp(0:10,2,8)

coerce

coerce a vector to contain only TRUE and FALSE

Description

coerce a vector to contain only TRUE and FALSE

Usage

```
coerce(x, default = FALSE)
```

Arguments

x Numeric/logical vector/matrix to coerce into TRUE/FALSE

default default returned value if NULL or NA is encountered

Value

logical vector or matrix with only T and F

4 combobulate

Examples

```
coerce(NULL)
# FALSE

coerce(c(T,F,NA,NA,T))
# T F F F T

coerce(matrix(c(T,T,F,F,NA,NA),nrow=2))
# [,1] [,2] [,3]
#[1,] TRUE FALSE FALSE
#[2,] TRUE FALSE FALSE
```

colVars

Compute column and row variances

Description

Compute column and row variances

Usage

```
colVars(x, na.rm = T)
rowVars(x, na.rm = T)
```

Arguments

x an input matrix of data.frame

na.rm Logical indicating whether NA values should be omitted before variance

computation

combobulate

Get all possible combinations of strings

Description

combobulate() returns all possible combinations of the provided character strings, each combination merged into a single string.

Usage

```
combobulate(...)
```

Arguments

... Character vectors to combobulate.

Value

A character vector.

comboTable 5

Examples

```
combobulate("Hello ",c("Sir","Madam"),", ",c("may I take your order?","what shall it be?"))
# [1] "Hello Sir, may I take your order?"
# [2] "Hello Madam, may I take your order?"
# [3] "Hello Sir, what shall it be?"
# [4] "Hello Madam, what shall it be?"
```

comboTable

Generate a matrix of combinations of values

Description

Generate a matrix of combinations of values

Usage

```
comboTable(...)
```

Arguments

. . .

Character vectors, named or unnamed, or unquoted names of named arguments. Character vectors will be used to generate a matrix where each row represents a unique combination of all values, akin to expand.grid(). Arguments which are unquoted names of named arguments will become copies of the column generated by the eponymous named character vector.

Value

A matrix.

Examples

```
\label{eq:hh} $$hh<-c("a","b")$ testfunc(a=letters[1:3], b=2,a,b,c=c("e","f"),d,c,d=hh,"huh",a,hh)$
```

compcorr

Test if two correlation coefficients significantly differ

Description

Uses Fisher's r to z transformation, then performs a z-test on the resulting z-scores

Usage

```
compcorr(cor1, cor2, n1, n2)
```

Arguments

cor1, cor2 Correlation values being compared n1, n2 Sample sizes of the correlation coefficients CorrCrunch

Value

List containing the z-score and p-value

References

http://vassarstats.net/rdiff.html

CorrCrunch

Analyse the robustness of a correlation

Description

CorrCrunch() computes the minimum number of cases that need to be removed from a dataset to flip the sign of a correlation coefficient. This can be useful in distinguishing genuine correlations from spurious findings that hinge on one or two outliers. Cases are removed iteratively; in each iteration the case that maximally shrinks the correlation coefficient is removed.

Usage

```
CorrCrunch(x, y, verbose = F)
```

Arguments

x, y Numeric vectors to correlate.

verbose if TRUE, prints verbose output.

Value

A list containing the number of cases that need to be removed to flip the sign of the correlation coefficient; the proportion removed cases in the data; and a data.frame without these cases.

Examples

```
CorrCrunch(mtcars$mpg,mtcars$wt)
#Holdout needed to flip the sign: 19 (63.33%)
#Final r: 0.01181141
```

CorTable 7

CorTable

Create a Correlation Table

Description

Create a Correlation Table

Usage

```
CorTable(df, rowids, columnids, rowdf, columndf)
```

Arguments

df

A data frame.

rowids, columnids

character vectors containing column names from df that need to be correlated.

rowdf, columndf

data.frames whose columns need to be correlated. Either df,rowids,& columnids or rowdf & columndf are required.

Value

A formatted markdown table containing correlation coefficients, p-values, and the number and percentage of cases that need to be removed to flip the sign of each correlation coefficient.

Examples

```
CorTable(mtcars,rowids=c("mpg","disp","hp"),columnids=c("drat","wt","qsec"))
CorTable(rowdf=mtcars[,c(1,3,4)],columndf=mtcars[,5:7])
```

df.init

Initiate an empty data frame

Description

Initiate an empty data frame

Usage

```
df.init(namelist)
```

Arguments

namelist

A character vector of column names.

Value

A data.frame with 0 rows.

8 ExtractRandomTerms

ExpandFormula

Parse a lme4 formula and return all main effects and interactions as separate terms

Description

Parse a lme4 formula and return all main effects and interactions as separate terms

Usage

```
ExpandFormula(form)
```

Arguments

form

Value

The same formula, but with all interactions and mai neffects as separate terms

Examples

```
ExpandFormula(rt ~ pull * target + (pull * target | subjectid))
#rt ~ pull + target + pull:target + (pull + target + pull:target | subjectid)
```

ExtractRandomTerms

Extract random terms from a lme4 formula

Description

Extract random terms from a lme4 formula

Usage

ExtractRandomTerms(form)

Arguments

form

A formula

Value

A named list containing character vectors with random terms; names are group variables.

Examples

FindTopTerms 9

FindTopTerms	Find all model terms that are not moderated by a higher-order
	interaction

Description

Find all model terms that are not moderated by a higher-order interaction

Usage

```
FindTopTerms(form)
```

Arguments

form

a formula

Value

A character vector containing all model terms that are not moderated by a higher-order interaction.

Examples

```
FindTopTerms(speed ~ skill + weight * friction)
#[1] "skill" "weight:friction"
```

LevenshteinDistance

Levenshtein distance

Description

Counts the number of single character deletions, insertions, and substitutions that need to be performed to turn the source string into the target string.

Usage

```
LevenshteinDistance(source, target)
```

Arguments

```
source, target Strings to be compared.
```

Value

The Levenshtein distance between the two strings.

Examples

```
LevenshteinDistance("Yoghurt", "Youtube")
```

10 multimerge

logit.weightfun

 $Downweight\ outliers$

Description

Computes weights; trials within certain bounds of the mean receive the maximum weight while trials outside these bounds are downweighted to 0 or an optional minimum.

Usage

```
logit.weightfun(
    x,
    mean = mean(x),
    s = sd(x),
    sdist = 3,
    taper = 10,
    scale = c("max", "norm"),
    min = 0
)
```

Arguments

Χ	A numeric vector
mean	An optional mean of the vector
S	An optional standard deviation of the vector
sdist	The number of standard deviations beyond which values should be down-weighted
taper	A number indicating how strongly values exceeding the standard deviation should taper off
scale	How the weight vector should be scaled: "norm" sets the sum to 1, "max" sets the maximum to 1.
min	A minimum weight.

Value

A numeric vector of weights

multimerge

 $Merge\ Multiple\ Data\ Frames$

Description

This function makes calls to <code>merge()</code> to merge every other dataset with the one next to it, repeating until only one dataset remains.

Usage

```
multimerge(x, ...)
```

OLcrunch 11

Arguments

x a list of data frames

... all other arguments for merge can be provided here

Value

A single, merged data.frame

Author(s)

Sercan Kahveci

Examples

OLcrunch

Crunch Outliers

Description

Crunch Outliers

Usage

```
OLcrunch(x, DS = 3, hardlimit = NULL)
```

Arguments

x Numeric vector to remove outliers from

DS A positive numeric value. If value exceeds this many standard deviations,

it is counted as an outlier

hardlimit A numeric vector with two values. If set, values below the first value

and above the second will be counted as outliers, and means/standard deviations will be computed from values within these bounds only.

Value

Vector with outlying values set to NA

12 read.csv.folder

pair

Create unique pairs

Description

Combines vectors such that unique unordered sets are derived from the vectors' cross sections.

Usage

```
pair(...)
```

Arguments

... two or more vectors of equal length

Value

a character vector consisting of all input vectors concatenated term-by-term and in alphabetic order.

Examples

```
pair(1:4,4:1)
#[1] "1-4" "2-3" "2-3" "1-4"
```

read.csv.folder

Read and merge all .csv files in a folder

Description

Read and merge all .csv files in a folder

Usage

```
read.csv.folder(
  folder = "./",
  readfunc = list(read.csv, read.csv2, read.table)
)
```

Arguments

folder path to a folder

readfunc list of functions that will be used to read the files; if the first function

fails, the second function will be used, etc.

Value

A data.frame containing all merged .csv files

RemoveTopTerms 13

_		_
Remove	T∩n⁻	Terms

 $Remove\ all\ possible\ models\ with\ one\ unmoderated\ term\ removed$

Description

Remove all possible models with one unmoderated term removed

Usage

```
RemoveTopTerms(form, randeff = "")
```

Arguments

form A formula

randeff The name of the group from which unmoderated terms should be removed.

To remove from fixed effects, use "" (the default).

Value

A list of formulas which have one unmoderated term removed each. The name of each list item is the term which was removed.

Examples

```
RemoveTopTerms(a ~ b * c + d + (1|e))

#$d

#a ~ b + c + b:c + (1 | e)

#$`b:c`

#a ~ b + c + d + (1 | e)
```

retype

Change classes of columns in a data.frame

Description

retype() changes the class of specific columns; retype_all() changes the class of all columns of a given class.

Usage

```
retype(df, ...)
retype_all(df, from, to)
```

14 set ColNames

Arguments

Examples

```
sapply(ToothGrowth, class)
             supp
#"numeric" "factor" "numeric"
NewToothGrowth <- retype(ToothGrowth, supp = character(), dose = factor())</pre>
sapply(NewToothGrowth,class)
      len
             supp
                             dose
#"numeric" "character"
                         "factor"
sapply(mtcars,class)
                         disp
                                     hp
                                             drat
       mpg
            cyl
# "numeric" "numeric" "numeric" "numeric" "numeric" "numeric"
            VS
                                             carb
      qsec
                      am
                                   gear
# "numeric" "numeric" "numeric" "numeric" "numeric"
newmtcars <- retype_all(mtcars, "numeric", "character")</pre>
sapply(newmtcars,class)
         mpg
                    cyl
                               disp
                                             hp
  "character" "character" "character" "character"
#
         wt
                   asec
                                 ٧S
                                                       gear
                                            am
  "character" "character" "character" "character" "character" "character"
```

setColNames

Set column and row names of an object These are convenience functions that return an object with its column or row names changed. Use it in pipes.

Description

Set column and row names of an object These are convenience functions that return an object with its column or row names changed. Use it in pipes.

Usage

```
setColNames(x, names)
setRowNames(x, names)
```

Arguments

```
x an object column or row names to be assigned to the object
```

smoothvect 15

smoothvect

Smooth a numeric vector using a moving window algorithm

Description

Smooth a numeric vector using a moving window algorithm

Usage

```
smoothvect(vect, width = 2, both.sides = T, alg = c("mean", "gauss"))
```

Arguments

vect

width Over how many values should the vector be averaged?

current index. If FALSE, only takes values ahead of the current index.

Value

Smoothed numeric vector

Examples

```
temp<- smoothvect(beaver1$temp)
plot(temp,type="1")</pre>
```

splitColumn

Split a character column into multiple values

Description

Split a character column into multiple values

Usage

```
splitColumn(x, sep = ";")
```

Arguments

x a character vector to split into columns sep a caracter separating the different values

Value

a data.frame of boolean values, with rows representing the unpacked vector entries and columns indicating whether the specific value

TransformPlots

theme_pecher

Pecher theme for ggplot Based on the plot design style of prof. Diane Pecher.

Description

Pecher theme for ggplot Based on the plot design style of prof. Diane Pecher.

Usage

```
theme_pecher()
```

tokens_compound_stepwise

Compound tokens without overflowing memory and crashing R

Description

A wrapper around tokens_compound that processes your tokens in chunks, set by argument stepsize. See tokens_compound for more info.

Usage

```
tokens_compound_stepwise(
    x,
    pattern,
    stepsize = 100,
    concatenator = "_",
    valuetype = c("glob", "regex", "fixed"),
    case_insensitive = TRUE,
    join = TRUE
)
```

TransformPlots

Title

Description

Visualize how different transformations of the data will fit to a normal distribution.

Usage

```
TransformPlots(x)
```

Arguments

Χ

A numeric vector.

Examples

TransformPlots(mtcars\$disp)

trypackages 17

trypackages

Install packages if necessary, then load them.

Description

Install packages if neccesary, then load them.

Usage

```
trypackages(...)
```

Arguments

... Unquoted names of packages to try loading, and if unable, install and

Examples

```
trypackages(stats,utils,compiler)
```

 $verify_types$

Verify variable types in bulk

Description

Verify variable types in bulk

Usage

```
verify_types(...)
```

Arguments

Named arguments, where the argument is the object to be checked and the name of the argument is the mode (numeric, list, character, etc)

Value

Returns true on success, causes error if not.

18 wtd.median

wtd.median	$Weighted\ Me$	dian
------------	----------------	------

Description

Weighted Median

Usage

```
wtd.median(x, wts, na.rm = T)
```

Arguments

x an input vector
wts a vector of weights

na.rm Logical indicating whether NA values in the input and weight vectors

should be stripped.

Value

A weighted median of the input values and weights.
